

Controls Audit & Design-for-Hire

A Short, Scoped Controls Engagement for Clarity, Risk Reduction, and Clean Handoffs

Overview

The Controls Audit & Design-for-Hire offering provides short, fixed-scope controls engineering support for teams that need clarity, risk reduction, or senior-level guidance — without long-term ownership or staffing commitments.

Engagements are intentionally bounded and designed to deliver a clear technical outcome that your internal team or integrator can confidently act on.

When This Is a Good Fit

This service is well suited when: - A controls system works, but feels fragile or hard to reason about - Issues surface repeatedly during startup, commissioning, or service - Control logic intent is unclear or undocumented - Teams want a senior review before building or deploying - You need clarity and confidence, not another long-term resource

This is not a replacement for in-house engineers or integrators.

Engagement Options

Each engagement is scoped as **one of the following**, not both.

Option A — Controls Systems Audit (Review)

A focused review of an existing controls system to identify risk, ambiguity, and likely failure modes.

Typical review areas include: - sequencing and control logic intent - IO mapping and signal assumptions - interlocks and fault handling (logic-level) - gaps between documentation and program behavior - handoff risks between engineering and field

The outcome is a clear, prioritized set of findings and corrective recommendations.

Option B — Controls Design-for-Hire (Design)

A defined controls design package for a specific system or project, intended for implementation by your team or integrator.

Typical design elements include: - written sequence of operations - mode and state definitions (auto/manual, start/stop, fault, recovery) - signal intent and assumption notes - edge-case handling guidance - commissioning and verification checklist

This option focuses on design clarity, not implementation ownership.

Scope and Boundaries

To keep engagements predictable and effective, the following boundaries apply: - One system, panel, machine, or project per engagement - Fixed scope and defined deliverables - No ongoing on-call or operational support - No open-ended ownership or maintenance obligation - No business IT or non-controls automation work - Implementation, if needed, is scoped separately

How the Engagement Works

1. Scope Confirmation

A brief intake aligns on: - the specific system or project - success criteria - inputs available (program export, drawings, IO lists) - explicit exclusions

2. Audit or Design Work

Work is performed independently with minimal disruption, supported by limited clarification conversations as needed.

3. Handoff & Close

Deliverables are reviewed together in a short walkthrough to: - clarify findings or design intent - answer questions - confirm clean closure

There is no assumed follow-on work.

Typical Engagement Parameters

- Duration: typically 3–10 business days, depending on scope

- Fee: fixed-fee, commonly in the **\$3,000–\$15,000** range based on complexity
-

Outcomes

Clients gain: - reduced field and commissioning risk - clearer ownership of control logic intent - improved handoff between engineering and field teams - confidence that systems will behave as expected

Summary

The Controls Audit & Design-for-Hire offering provides senior-level controls clarity in a contained, low-risk format — delivering useful guidance and clean handoff without long-term dependency.
