

Process & Information Flow Audit

A Short, Fixed-Scope Review to Reduce Friction and Improve Handoffs

Overview

The Process & Information Flow Audit is a fixed-scope engagement designed to identify where information, decisions, or ownership break down in a real workflow, implement one practical improvement, and leave the team operating with greater clarity and less friction.

This audit focuses on how work actually happens — not on software implementation, organizational redesign, or long-term consulting support.

When This Audit Is a Good Fit

This service is well suited for teams that: - Are operational but inefficient - Experience rework, confusion, or last-minute surprises - Rely on individual memory or informal communication channels - See recurring issues during handoffs between teams or roles

It is not intended for organizations seeking a broad transformation initiative.

Scope of Review

Each engagement is intentionally limited to ensure focus and clarity. The scope includes: - One defined workflow (e.g., sales to engineering, engineering to field, or field feedback to design) - One recent or active project used as a reference - Review of how information, decisions, and responsibilities move through the workflow - Identification of points where assumptions are lost or rework is introduced

The audit does not involve system builds, software development, or ongoing operational ownership.

Items Explicitly Out of Scope

To keep the engagement predictable and effective, the following are excluded: - Full organizational redesign - Implementation of enterprise software or IT systems - Controls programming or system execution - Ongoing support or advisory retainers - Expansion beyond the agreed workflow

How the Audit Works

1. Scope Confirmation

A short intake discussion defines: - the specific workflow under review - success criteria in plain language - what is intentionally excluded

This step ensures alignment before work begins.

2. Current-State Review

The audit includes: - brief conversations with involved roles - review of existing artifacts (emails, spreadsheets, documents) - observation of how information is actually shared and used

The goal is to capture reality, not prescribe solutions prematurely.

3. Friction Analysis

A concise analysis identifies: - 3–5 high-impact friction points - where information is delayed, duplicated, or lost - downstream effects such as rework, errors, or stress

Issues are prioritized by operational impact.

4. One Practical Improvement

One improvement is selected and implemented collaboratively. Examples include: - a clarified handoff checklist - a decision or change log - a standardized intake or clarification form - a lightweight process note or SOP

The improvement is designed to be immediately usable by the team.

5. Close & Handoff

At the conclusion of the audit, the client receives: - a written summary of findings - documentation of the implemented improvement - clear delineation of what remains out of scope

Any further work is scoped separately and is optional.

Typical Engagement Parameters

- Duration: approximately 2–3 weeks
- Fee: typically \$5,000–\$10,000, depending on scope and complexity

The engagement is delivered on a fixed-fee basis.

Outcomes

Clients can expect: - clearer ownership and accountability within the workflow - reduced rework and miscommunication - more reliable handoffs between teams - improved operational predictability

Summary

The Process & Information Flow Audit provides a structured, low-risk way to address operational friction in a single workflow — delivering practical improvement without long-term dependency.
